Higg Facility Environmental Module

Developed by the Sustainable Apparel Coalition, the Higg Facility Environmental Module (Higg FEM) is a sustainability assessment tool that standardizes how facilities measure and evaluate their environmental performance, year over year.

Facilities that use the Higg Index are committed to improving the global value chain to ensure apparel, footwear, and textile manufacturing supports the well-being of people and the planet. The Higg FEM helps facilities strengthen relationships with their business partners, identify environmental sustainability risks and hotspots, and make annual improvements.

Facilities demonstrate their commitment to environmental sustainability, value chain collaboration and transparency through voluntary disclosure of their Higg FEM performance.

How to Read the Higg Index

LEVELS

Levels signify general thresholds of good, better, and best environmental management practices.

Zero points: The facility scored 0 points on the Higg FEM assessment and has the opportunity to start implementing environmental management practices.

Beginner - The facility started Higg FEM level 1; It has not completed level 1. The facility is starting to identify its sustainability risks and impact areas.

Intermediate - The facility completed Higg FEM level 1. The facility established a measurement system to assess sustainability risks and impact areas.

Advanced - The facility completed Higg FEM level 2. The facility implements advanced measurement practices to assess sustainability risks and impact areas.

Leader - The facility completed Higg FEM level 3. The facility implements leading measurement practices to assess sustainability risks and impact areas.

The Higg FEM is NOT a pass/fail assessment, rather a tool that identifies opportunities to improve sustainability performance continuously. The scoring system is designed to drive improvements to sustainability management practices.
